The science of gravity is one of the most fundamental of all physical sciences. It is also one of the least well understood, yet one of the most important for the way people live. Gravity is the force that holds us to the earth, but it also holds the moon to the earth, and the sun to the moon. It explains why the tides go up and down, why the continents rise and fall, and why stars twinkle. Gravity is a force that is felt everywhere, in all the universe from an apple on the ground to an astronaut on the moon. Yet, the interaction between a particle and a mass are two completely different forces. In a particle physics course, you learn about the behavior of the particles that make up the universe, but this is a much different subject from gravity. This course combines the subjects of particle physics and gravity into a single course of study in a way that reveals the similarities and differences between the two. This book is about the characteristics of the material world that are essential to its dynamics and about the thermodynamic principles that relate the properties of matter to the entropy of the system. We first study the microstates of equilibrium systems. We then study the processes in non-equilibrium systems in the context of a microscopically balanced system. We define the entropy as a function of energy. We consider the second law of thermodynamics and derive its fundamental equation. Next, we study the entropy of a subsystem and the entropy of the whole system. We analyze the absolute temperature and the heat capacity of the system and discuss the notion of entropy in different systems. Finally, we address the fundamental laws of thermodynamics and other topics in this area like the engine cycle and the adiabatic process. We formulate statistical physics of phase transitions and the principle of maximum entropy. We also discuss the behavior of entropy at the macroscopic level and compare the results with the microscopic.
