Very cool new features are being built into Lightroom in real-time. A Feature list you can find with a simple right-click on any image has sections for "Autoflip", "Masks", "RGB Curves", "Color Curves", "Layers", "Vectors", and "Convert to Black and White." We know that the latter has been available in other photography apps for some time, and the build into the product is simply a matter of whether you're using Lightroom or a different app, but it's still nice to see a steady stream of new likes being built in. Adobe has essentially done it again with Photoshop CC. This time around, the company just made some small improvements that complement the existing, established workflow. In particular, they've made the post-sorting feature a lot easier to use and there is a few native RAW processing features that are really nice when you work with large photo libraries. Colorama is perhaps the most exciting new feature and leverages the use of GPU-based processing to offer a solid color-ramping plug-in that keeps you on track when creating and blending color layers. The tool uses sophisticated GPU-based features that should provide faster performance on lower-powered machines and for larger video files. Adobe also made the 6-bit channel support native within the RAW workflow engine. And it's interesting to see that there's now an option for "Prioritize Exported Layers." This is a very common task for any photographer's workflow and Adobe now makes it easier to, as the name suggests, prioritize the layers before exporting. The Photo Merge feature is another nice addition that allows you to automatically delete duplicate instances of people and pets. The same goes for duplicates in the document. There is also now a Merge and Sharpen tool and a Quick Fix button that allows you to input a new dynamic point in the image, making the tool a lot more potent. Overall, I think Adobe did a good job of staying true to the core principles of Photoshop in Photoshop CC. I think a little more Adobe Originals' new workflow innovations may have been good to see. I really like the built-in screen dimmer, particularly on a laptop. If the company can make more tweaks, the release schedule for updates will be more frequent and it should have a more constant impact on the camera RAW workflow.

Using specialized software by Adobe, you can work with opaque layers. Opaque layers are ones that have no transparent edges and are usually used for things like photo editing. However, it's possible to make layers transparent. Using special software, it's possible to rasterize the shape you want hidden by overlaying it with an opaque layer and then transparently removing part of that layer. Opaque layers make it easier to make complex shapes than other methods. Using G'MIC, you can apply a set of G'MIC enhancements to your images.
